

I fully concur with FISTS CW Club petition with the following exception.

I propose that the 80 meter sub-band, 3675-3725kHz, be limited to CW as a digital mode. This sub-band is used extensively by ARRL National Traffic System training nets to teach CW traffic handling methods, procedures and formats. Net procedures require dispatching of stations up and down the band in pairs (instructor/student) off the Net frequency. This could result in much unintentional interference to other digital modes if they were operating within this range.
